

deriv <AI> Hackathon

8 - 9 FEB 2025 | CYBERJAYA

POWERED BY
JOMHACK
EMPOWERING INNOVATION

SHAPE THE
FUTURE with **AI**

Starts
8 Feb, 8am

Ends
9 Feb, 6pm

Deriv HQ,
Cyberjaya

The Challenges

Challenge 1: UI Validator

Build an AI-powered testing mechanism that can compare the Figma designs against the implementations, ensuring flawless user interfaces.

Mentors: Lipika & Matin

Challenge 2: Dispute Resolution

Build an AI-powered assistant to enhance fraud detection and streamline dispute resolution within a DP2P platform. The goal is to automate processes, improve security, and enhance user experience.

- Dispute resolution within 2 hours
- Reduction in manual workload for agents
- Early fraud detection & prevention
- Improved user trust & security

**Mentors: Jeyavarthini, Amidu, Patricia, Ana Paula,
Jose Bogarin & Dana**

Challenge 3: Social Trading

Build an AI-powered social trading platform that enables users to follow, interact with, learn or copy trades from successful traders, fostering a community of shared knowledge and strategies.

Mentors: Kuan Lim Phang, Kai Jie Tang & Yng Shan Tan

Challenge 4: Threat Scanner

AI-Driven Web Application & Network Pentest

Build an AI-powered penetration testing solution that autonomously maps web applications, APIs and network assets while detecting and prioritizing vulnerabilities across application and network layers. The solution should dynamically adapt its scanning strategies in real-time based on findings, enabling it to uncover sophisticated exploits. It must also provide clear, actionable insights to developers and security teams, ensuring efficient remediation. Scalability, efficiency, and the ability to address modern security challenges are key to success.

Mentors: Sathish, Weng Onn & Marianne

Challenge 5: Fraud Prevention

AI-Driven detection and action for non-trading clients & clients pretending to trade

Build an AI-powered tool that can automatically detect clients that have deposited and withdrawn funds without performing any trading activities on of our platforms eg: MT5, DerivX, cTrader etc, AND clients that are pretending to trade (performing short trades in quick succession using minimal amounts without generating significant profits/losses to appear as if legitimately trading). The tool would analyze the deposit/withdrawal activities of these clients against clients trading activities on all our platforms. The tool should also automatically lock these clients' accounts and send emails to request for further information and clarification for their activities. These accounts and emails should then be delivered to the Anti-Fraud team for further analysis. In addition to the above, the tool should also have the capability of generating reports of clients behaving the same way in different regions, using similar payment methods etc. Further, the tool would also compile the fees absorbed from clients' deposit & withdrawal activities for analysis of the financial impact of these activities on the company. This tool would reduce the manual work involved in checking accounts one by one, locking the accounts and drafting emails to be sent.

Mentors: Rajveen & Maisarah

Challenge 6: Payment Resolution

Build an AI-powered tool that can automatically reconcile deposit and withdrawal transactions by matching data from the payments portal and the back office. The tool would flag discrepancies, such as missing payments or duplicate transactions, and categorize them based on predefined criteria. Additionally, for account closure cases, the tool would calculate the winnings and deposits to be refunded, with options to rescind winnings, transfer funds to another account, or debit the account for a refund. This integrated solution would reduce manual effort, minimize errors, and speed up both the reconciliation and refund processes, allowing the team to focus on more complex cases.

Mentors: Thevathaasan, Vivian, Pua Geok Kheng & Hafiez
